STORM Manager

1 Versioning

Each file has a monotonic version (v1, v2, v3, ...)

2 Validation (Write)

1 Reservation Check

Check if the file is reserved by another agent (up to 30s)

Reservation = exclusive lock to prevent concurrent writes.

2 Version Check (Direct)

expected → current

Compare expected_version (with agent) with current_version (on disk). Mismatch = CONFLICT.

3 Snapshot Validation (Transitive)

Agent's Snapshot (at read time)	Current Versions (at write time)
a.py v5	a.py v5 ✓
b.py v3	b.py v4 ✗
c.py v2	c.py v2 ✓

Check all files in the agent's snapshot (dependencies). If any version changed by others → STALE DEPENDENCY

3 On Success

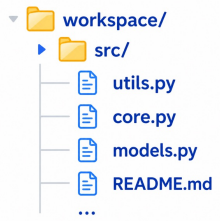

Write to workspace, bump version (v+1). Return success.

4 On Failure

Return to agent:

- Target file current content + diff
- Stale dependency list (path, version, last modifier)

Agent resolves and retries with the latest info.

Shared Workspace (Same for All Agents)

utils.py v12

```
def add(a, b):  
    return a + b  
...
```

core.py v8

```
class Engine:  
    def run(self):  
        ...  
...
```

models.py v6

```
class Model:  
    def predict(self):  
        ...  
...
```
