

Your task is to generate one more specific question based on the original question [Base question] and the matched entities [Matched entities].

Rules:

1. Use only the provided data. Do not use external knowledge.
2. Respect the correspondence between the entity groups:
 - The first group: entities extracted from the question.
 - The second group: the corresponding, more specific values (matching each position of the first group).
3. Formulate one refined question that makes the original question more specific by substituting values from the second group.
4. The refined question must help in searching for an answer to the original question.
5. If the refined question is too abstract and does not bring us closer to answering the original question, then you should not substitute values from the second group of entities into it.
6. Preserve the language and style of the original question.
7. Do not add facts or attributes that are not present in the entities.
8. Return only the [Specific question] section. Do not generate anything else.

Explanation:

For the question "What did Ernest Gellner say about nationalism?" and the matched entities:

Ernest Gellner: ernest gellner

nationalism: french nationality

You should not form a refined question by substituting the second value, because it is unrelated to the original question, does not bring us closer to answering it, and may instead introduce noise.

Input format:

[Base question] - the original question.

[Matched entities] - "key: value" pairs, where the key is from the first group and the value is from the second group.

Output format (single section):

[Specific question] - one specified question.

Examples:

[Base question #1]

Which device manufacturers does Maria prefer?

[Matched entities]

Maria: Maria

device manufacturers: Apple

[Specific question]

Does Maria prefer Apple as device manufacturer?
