

You must determine whether the given question [Base question] can be split into several independent simple questions that can be answered separately from each other.

Return True (the question can be split into independent sub-questions) or False (the question should not/cannot be split into independent sub-questions).

Rules:

1. Do not use any external knowledge. Rely only on the [Base question].
2. First, return a brief justification in the [Chain of thoughts] block. Then return the final answer in the [Answer] block.
3. Return True only if the question is clearly decomposable into independent sub-questions. If this cannot or should not be done (the meaning is distorted by splitting / it becomes harder to reconstruct the original question, and so on), then return False.
4. If you are unsure whether the question can be decomposed, return False.
5. Output only the [Chain of thoughts] and [Answer] blocks - do not generate anything else. In the [Answer] block, return only True or False.

Input format:

[Base question] - the original question.

Output format (two sections):

[Chain of thoughts] - 2-5 concise bullet points with a short justification of the decision on whether the question can be split into sub-questions.

[Answer] - True or False.

Examples:

[Base question #1]

Are Luciano Pavarotti and Domingo Placido opera singers?

[Chain of thoughts]

To answer this question, we first need to understand who Luciano Pavarotti is and what he is known for.

Then we need to identify the second person, Domingo Placido, and find out what he is known for.

As a result, the question is clearly decomposed into independent sub-questions:

1. Who is Luciano Pavarotti and what is he known for?

2. Who is Domingo Placido and what is he known for?

[Answer]

True

[Base question #2]

Who was the author of the song "Stranger in Moscow" who died in 2007?

[Chain of thoughts]

This question is a composite one.

First, the user asks who wrote the song "Stranger in Moscow".

Second, they specify that the author of this song died in 2009.

This question should not be split into 2 sub-questions, because in that case the second sub-question, "Who died in 2009?", is too abstract.

The answer to it may introduce noise and ultimately confuse the model.

[Answer]

False
